The spread of the reflexive adjunct middle in the Limburg dialects: 1885-1994

Leonie Cornips

0. Introduction

It is intriguing that in Standard Dutch, unlike other Germanic languages such as English and German, a special kind of a middle construction shows up, namely the so-called adjunct middle in (1). In general, it is assumed that the adjunct middle has the following characteristics: (i) the logical subject argument is syntactically absent but semantically present, (ii) the grammatical subject, such as deze zaal `this hall' in (1a), denotes a location and (iii) the adverb, such as gemakkelijk `easily', has to be present (if there is no focus intonation or negation) (cf. Hoekstra&Roberts (henceforth: H&R) 1993, Ackema&Schoorlemmer (henceforth: A&S) 1994/95 and Keyser&Roeper 1984); SD = Standard Dutch):

(1) SD a. Deze zaal zingt gemakkelijk
    this hall sings easily

SD b. Dit bed slaapt gemakkelijk
    this bed sleeps easily

Interestingly, in Standard Dutch another kind of construction exists which is at first sight similar to the adjunct middle in (1), namely the instrumental construction in (2). In (2), however, the grammatical subject does not denote a location, but an instrument:

(2) SD Deze ink schrijft goed
    this ink writes well

An interesting issue that arises is to what extent the instrumental construction in (2) corresponds to the adjunct middle in (1). Recently, the two kinds of constructions have been discussed by H&R and A&S. In A&S, it has been proposed that in the instrumental construction the logical subject argument is not syntactically present, as is the case in the adjunct middle. In H&R, however, it has been argued that in the instrumental construction the logical subject argument is realized as the grammatical subject. Thus, A&S's proposal differs from H&R's proposal in that in the former but not in the latter the two constructions are analyzed on a par and, hence, they have a similar underlying structure. It is relevant to note that since in Standard Dutch the instrumental construction and the adjunct middle have similar surface structures they do not provide direct clues for one of the two proposals.

It is noteworthy, however, that some language varieties of Dutch, e.g. the Limburg dialects, show morphological marking in middle constructions. This is shown in the following example of an impersonal middle taken from the Limburg dialect. (3) indicates that this dialect differs from Standard Dutch in that it makes use of the reflexive zich. Generally, it is assumed that in the impersonal middle, like (3), (i) the pronoun

---

1 I would like to thank Hans Broekhuis, Marcel den Dikken and Aafke Hulk for their valuable comments on an earlier version of this paper and Marianne Starren for questioning speakers of the Heerlen dialect.
‘t ‘it’ is an expletive subject and (ii) in addition to the adverb lekker ‘nicely’ (cf. (1)), the locational PP, such as op dizze stool ‘on this chair’ is obligatorily present (SD = Standard Dutch, LD = Limburg dialect):

(3) *SD/LD ‘t zit zich lekker op dizze stool
expl sits REFL nicely on this chair

The purpose of this paper is to examine whether in the Limburg dialects the instrumental construction and the adjunct middle have an identical underlying structure (cf. A&S) or not (cf. H&R), or rather, to what extent the dialects of Limburg distinguish between the adjunct middle and the instrumental construction by means of the reflexive zich. In order to get a better insight into the syntactic properties of the instrumental construction and the adjunct middle in the dialects of the province of Limburg I will describe their geographical distribution in 1885 and the changes in it between 1885 and 1994 (cf. section 1).

With respect to the Limburg dialects, I will demonstrate that (i) all middle constructions require the reflexive zich, (ii) since 1885 the instrumental construction has undergone a syntactic change such that it has become a reflexive middle construction and (iii) from a geographical and chronological point of view the adjunct middle in (1) follows the impersonal middle in (3) (cf. section 2). We will see that neither the proposal of H&R nor the proposal of A&S can fully account for the diachronic data we will encounter. This paper will be concluded with a possible analysis that (i) accounts for the presence of zich in the middles in the Limburg dialects and (ii) accounts for the geographical and chronological implicational relationship between the adjunct and impersonal middle in the Limburg dialects.

1.0 The geographical distribution of the instrumental construction and the adjunct middle in the dialects of Limburg in 1885 and 1994

In this section, I will present a detailed geographical distribution of the instrumental construction and the adjunct middle, based largely on data from the Limburg dialects but also taking into consideration data from the surrounding dialects in Belgium (Flemish) and Germany (Rhineland) (cf. Cornips 1995). In order to gain a better insight into the syntactic properties of the instrumental construction and the adjunct middle, I will first describe their geographical distribution in 1885; subsequently I will outline the 1994 state of affairs.

1.1 The instrumental construction and adjunct middle in 1885. With respect to the instrumental construction based on the verb schrijven ‘write’ the geographical distribution can be described as follows. First, the Flemish and Limburg dialects only use the instrumental construction as is exemplified in (4). Note that this construction is the Standard Dutch variant (cf. (2), Fl = Flemish):

(4) 1885 Fl Hasselt a. Dieën aenkt schrif gout
1885 LD Maastricht b. Deen ink shrief good
1885LD Helden c. Daen ink schriefe göd this ink writes well

Secondly, in the Rhineland dialects two variants of the instrumental construction show up. The most frequent one is the Standard Dutch variant as illustrated in (5a). Strikingly, there are, however, two out of twenty-seven places that combine the instrumental construction with the reflexive zich, namely Düsseldorf and Grevenbroich, as shown in (5b,c). Note that neither Standard Dutch nor Standard German (cf. Fagan 1992) allows this reflexive instrumental construction. (Later, I will discuss these reflexive variants in more detail, RD = Rhineland dialect):

---

2 In this paper, I will not discuss the design of the survey and the methodology that is used to collect the data (cf. Goossens 1989 and Cornips 1995).
THE REFLEXIVE ADJUNCT MIDDLE IN THE LIMBURG DIALECTS: 1885-1994

(5) 1885 RD Aachen  a. Der Enk schrief got
     1885 RD Düsseldorf b. Di Tint shrifft zich jot
     1885 RD Grevenbroich c. Da enk schrif sich god

If we concentrate on the Limburg dialects, the data so far show that in these dialects the instrumental construction is construed similar to Standard Dutch. Let us turn now to the geographical distribution of the adjunct middle.

The geographical distribution of the adjunct middle differs considerably from the instrumental construction in that (i) more variants show up and (ii) the different variants are restricted to certain areas.

Again, the Flemish dialects only use the Standard Dutch adjunct middle:

(6) 1885 Fl Zoutleeuw a. Deë zoal zingtgemäkkle
     1885 Fl Tienen b. Deeë zoäl zingtlicht

In contrast, the Limburg and Rhineland dialects use the reflexive impersonal middle, as is illustrated in (7a) and (7b,c), respectively (cf. (3)). Note that the expletive *et* in the Rhineland dialects is, just as `impersonal middle' *es* in Standard German, not only restricted to sentence-initial position in main declarative clauses. This kind of expletive corresponds to Standard German *es* that has a distribution similar to referential subjects (Fagan 1992:45) or the Standard Dutch expletive *het*:

(7) 1885 LD (north) Posterholt a. In dej zaal zingt 't zich goed
     1885 RD Lechenich b. En däne sal sengt et sich god
     1885 RD Aachen c. Ine der zaal singt et sich gemäckl.

Furthermore, in the Rhineland dialects also the constructions in (8) occasionally show up. Interestingly, in contrast to the indispensable `impersonal middle' *es* in Standard German, these impersonal middles lack the expletive subject. Of course, constructions like (8) are only grammatical if the expletive element does not occupy the first position in the sentence (cf. (3)):

(8) 1885 RD Cranenburg a. In den zâl zingt
     1885 RD Steele a/d Ruhrb. In dann zal zingt
     1885 RD Waldfeucht c. En det bet shliëpt
     1885 RD Kempen d. En det bet shloep zich jut

Furthermore, in the Rhineland dialects also the constructions in (8) occasionally show up. Interestingly, in contrast to the indispensable `impersonal middle' *es* in Standard German, these impersonal middles lack the expletive subject. Of course, constructions like (8) are only grammatical if the expletive element does not occupy the first position in the sentence (cf. (3)):

(9) 1885 LD (north) Helden a. Dae zâl zinkt sich göd
     1885 LD (north) Stevensweert b. Die zâl zink zig lig

Strikingly, the Limburg and Rhineland dialects do not only use the reflexive impersonal middle but in these dialects also the reflexive adjunct middle arises:
In addition, with respect to the two kinds of reflexive intransitive middles, a distinction has to be made between the northern part and the southern part of the province of Limburg since only in the former but not in the latter does the reflexive adjunct middle arises. Consider the following contrast in (9a,b) and (10c):\(^3\)

\begin{align*}
(10) \quad &1885 \text{ LD (south)} \quad Maastricht \quad a. \quad \text{In die zaal zink et zech gemekelek} \\
&1885 \text{ LD (south)} \quad Epen \quad b. \quad \text{In dn zaal zingt 't zich} \\
& 1885 \text{ LD (south)} \quad c. \quad \ast \text{Deze zaal zingt (zich)}
\end{align*}

easily in this hall sings it REFL.

easily

good this hall sings

Table 1 gives an overview of the Limburg and Rhineland data:

Table 1: Distribution of the instrumental and intransitive middle constructions in 1885

The findings so far can be captured as follows. It is evident that in 1885 in the Limburg dialects the instrumental construction and the adjunct middle cannot be treated on a par. The dialects in the northern part combine the adjunct middle with the reflexive \(zich\). This reflexive, on the other hand, is excluded in the instrumental construction. What is more, in the southern dialects the instrumental construction is fully grammatical whereas it is clear that the (reflexive) adjunct middle cannot be construed in that area. We will discuss this findings more extensively in section 2.

Furthermore, with respect to the dependent variable area, table 1 reveals a pattern that involves an implicational relation between the impersonal middle, adjunct middle and the instrumental construction (see bold print). That is to say, it shows that the reflexive instrumental construction implies the existence of the reflexive adjunct middle whereas this latter, in its turn, implies the existence of the reflexive impersonal middle.

1.2 The syntactic changes in the Limburg dialects between 1885 and 1994. The geographical distribution of the variants of the adjunct middle and the instrumental construction has changed drastically between 1885 and 1994. The first important change is that the adjunct middle with the reflexive \(zich\), i.e. the northern Limburg

\(^3\) The area that includes the locations Geleen and Sittard distinguishes the southern part of Limburg from the northern part.
THE REFLEXIVE ADJUNCT MIDDLE IN THE LIMBURG DIALECTS: 1885-1994

The reflexive adjunct middle, i.e. the northern Limburg variant, has become fully grammatical in the southern dialects of the province of Limburg. This syntactic change is illustrated in (11):

(11) 1885 LD (south) Heerlen a. I dat bet shliëpt et zich goot
in this bed sleeps it-EXPL

b. *Dit bed slaapt zich
1885

lekker
1994 LD (south) Heerlen c. Disse stool zit zich
lekker
this bed/chair sleeps/sits REFL easily

The most striking change, however, is that today all Limburg dialects allow the reflexive *zich in the instrumental construction, as can be seen in (12b) and (13b):

(12) 1885 LD (south) Maastricht a. Deen inkshrief (*zich) good
1994 LD (south) Heerlen b. Dieze ink sjrief zich
plezeerig
this ink writes

(13) 1885 LD (north) Helden a. Daen ink schriefe (*zich) goed
1994 LD (north) Swalmen b. Deze Ink sjrief zich
plezerig
this ink writes

So far, it has become clear that the dialects in Limburg demonstrate interesting syntactic changes through time and space. In sum, after 1885 (i) the reflexive adjunct middle, i.e. the northern Limburg variant, has become fully grammatical in the southern Limburg dialects and (ii) the instrumental construction with the reflexive *zich has emerged and it has spread throughout the dialects of the province of Limburg, too. Furthermore, in addition to the pattern in table 1, table 2 reveals from a geographical and chronological point of view that the creation of the reflexive instrumental middle follows the reflexive adjunct middle whereas this latter follows the reflexive impersonal middle. Thus, it is virtually certain that the spread of the reflexive adjunct middle has led to the appearance of the reflexive instrumental construction as a new variant.

So far, it has become clear that the dialects in Limburg demonstrate interesting syntactic changes through time and space. In sum, after 1885 (i) the reflexive adjunct middle, i.e. the northern Limburg variant, has become fully grammatical in the southern Limburg dialects and (ii) the instrumental construction with the reflexive *zich has emerged and it has spread throughout the dialects of the province of Limburg, too. Furthermore, in addition to the pattern in table 1, table 2 reveals from a geographical and chronological point of view that the creation of the reflexive instrumental middle follows the reflexive adjunct middle whereas this latter follows the reflexive impersonal middle. Thus, it is virtually certain that the spread of the reflexive adjunct middle has led to the appearance of the reflexive instrumental construction as a new variant.

Table 2: The syntactic changes in the Limburg dialects (1885-1994)

From the above, the following interesting questions arise: (i) why is *zich ungrammatical in the instrumental construction in 1885 whereas it is fully grammatical in 1994? (ii) why is *zich present in middle constructions? and (iii) how do we account for the geographical and chronological implicational relationship between the
reflexive impersonal middle, the reflexive adjunct middle and the reflexive instrumental construction? I will address these questions in the following section.

2.0 Towards a possible analysis of the reflexive adjunct middle

2.1 The presence of zich. From the above, it is obvious that in 1885 (i) the northern Limburg dialects distinguished the adjunct middle from the instrumental construction by means of the reflexive zich and (ii) in the southern dialects, in contrast to the (reflexive) adjunct middle, the instrumental construction was fully grammatical. With respect to the reflexive, the contrast between the adjunct middle and the instrumental construction can be accounted for if we assume that the implicit argument in middles is reflected morphologically in the Limburg dialects, that is to say, that zich manifests the absorption of the logical subject (where absorption should be taken to be neutral with regard to the various theoretical instantiations of this phenomenon) (cf. Zubizarreta 1987, Hulk & Cornips (henceforth: H&C) 1994). If the assumption given above is on the right track, it does not come as a surprise that in the Limburg dialects zich shows up in other kinds of constructions in which it is generally assumed that an implicit argument is present too, for example, in impersonal passives and inchoative constructions, such as (14a) and (14b), respectively (cf. Cornips & Hulk 1996) (HD= Heerlen Dutch):

(14) Heerlen Dialect  a. ’t weëd zich gewessje
     EXPL:was REFLEX.washed
     HD     b. De papieren wastewater zich uit de doos
            the papers blow REFLEX.out the box

Furthermore, we can account for the absence of the reflexive zich in the instrumental construction if we assume that this kind of construction lacks an implicit argument, that is to say, its grammatical subject must be analyzed as the logical subject. According to H&R (1993:218), this assumption is supported by the following observations. The contrasts in (15) and (16) indicate that in Dutch the verb in the instrumental construction differs from the verb in the adjunct middle in that (i) it can be combined with a different kind of adverb, for example dik ’thick’ and (ii) it can be construed as a transitive verb, e.g. with a direct object, such as de letter o in (15a) and (16a), respectively (cf. H&R 1993: 218):

(15) a. Deze inkt schrijft dik/goed
     b.Dezestoel zit (*dik)/goed
     this ink/chair writes/sits thick/well

(16) a. Deze inkt schrijft de letter o goed
     b.*Deze zaal zingt een lied goed
     this ink writes the letter o well
     this hall sings a song well

Let us turn now to the question of the diachronic development of the instrumental construction without a reflexive in 1885 into a construction with a reflexive in 1994. This syntactic change can be explained if we assume that the (transitive) verb in the instrumental construction which can be argued to project the logical subject argument into syntax has undergone ‘middle formation’ since 1885 and as a result a reflexive variant has emerged. So the idea is that nowadays the reflexive instrumental construction and the adjunct middle can be treated on a par. If the reflexive instrumental construction (cf. (12b), (13b)) is indeed comparable to adjunct middles, we would expect it to have other properties of adjunct middles as well, i.e. we would expect that it leads to an ungrammatical result if we combine it (i) with a different kind of adverb or (ii) with a direct object (cf. (15)-(16)). As is illustrated by means of the ungrammatical examples in (17a) and (17b), respectively, this expectation is borne out. Thus, the occurrence of zich goes hand in hand with a process of detransitivation or medialisation:
Crucially, *zich* does not only manifests the absorption of the logical subject but it also acts as an aspectual marker (cf. H&C 1994). To see this, compare the following adjunct middles in Standard Dutch and Heerlen Dutch. The presence of *zich* in the (b)-sentences determines the event structure for the entire sentence, namely presentational aspect. First, the ungrammaticality of (18b) indicates that, as opposed to (18a), the reflexive middle only allows the present tense. Secondly, unlike (19a), it leads to an ungrammatical result to combine the adjunct middle in (19b) with a durative adverb, such as *altijd* 'always'. Hence, the reflexive in the adjunct middle alters (sub) parts of events that are characterized by the verb:

```
(18) SD a. Deze schoenen hebben lekker gelopen
    HD b. Deze schoenen hebben *zich* lekker gelopen
    these shoes have REFL nicely walked
```

```
(19) SD a. Deze schoenen lopen altijd lekker
    HD b. Deze schoenen lopen *zich* (*altijd*) lekker
    these shoes walk REFL always nicely
```

Given the assumption that the reflexive instrumental construction is structurally identical to the adjunct middle, we would expect the same contrasts to show up. As (20) and (21) demonstrate, this expectation is indeed correct:

```
(20) SD a. Deze pen heeft goedgeschreven
    HD b. Deze pen heeft *zich* goedgeschreven
    this pen has REFL well written
```

```
(21) SD a. Deze pen schrijft altijd goed
    HD b. Deze pen schrijft *zich* (*altijd*) goed
    this pen writes REFL always well
```

The fact that *zich* alters the aspectual and temporal properties of the entire sentence and not only the Aktionsart of the verb can be accounted for if we tentatively assume that *zich* indicates a functional projection AspPhrase which must be outside the VP (cf. H&C 1994 for a more extensive discussion whether *zich* is the aspectual head or it occupies the SpecAspP position). The relevant part of the structure is: \[ {\text{Asp}} \, \text{zich} \, {\text{VP}} \ldots \]

2.2 The derivation of the adjunct middle. Recall that we still have to account for why, chronologically, the reflexive impersonal middle precedes the reflexive adjunct middle and this latter, in its turn, precedes the reflexive instrumental construction (cf. table 1 and 2). Let us propose that this implicational relationship can be accounted for if we assume that (i) the adjunct middle is created on the basis of the existing reflexive impersonal middle and that (ii) this creation has become productive to such an extent that the instrumental construction has undergone middle formation and as a result a reflexive variant has emerged. To this end, consider the two kinds of middles in the following (a) and (b)-sentences. As is clear from (22), the impersonal middle requires the preposition whereas in the corresponding adjunct middle the subject NP shows up without this preposition:

```
(22) a. it-EXPL V REFL ADV P NP
    a’ Het slaapt *zich* goed in dit bed
    a”Het schrijft *zich* goed met die pen
```
According to H&R the relationship between the impersonal middle and the adjunct middle is to some extent similar to the Dutch complex adjective constructions with the frame `it is PP nice for to V' and `NP is nice for to V', as demonstrated in (23a) and (23b), respectively. These constructions share the same property as the middles in (22), that is to say, the (a)-sentence requires the preposition while in the (b)-sentence the subject NP shows up without the preposition:

(23) a. Het is in Amsterdam leuk om te wonen  
    it is in Amsterdam nice for to live  
   b. Amsterdam is leuk om te wonen  
   Amsterdam is nice for to live

However, it seems that this relationship does not hold more generally. If it is indeed the case that the complex adjective constructions like (23) share the same property as the middles in (22), we would expect them to express the same relationship with other verbs that have the frame `V-PP' as well. As can be seen from (24b) and (25b), this expectation is not borne out for the (b)-examples still require the locational preposition:

(24) a. Het is in deze zaal prettig om te zingen  
    it is in this hall nice for to sing  
   b. Dezezaal is prettig om *(in)te zingen  
       this hall is nice for in to sing
(25) a. Het is in dit bed prettig om te slapen  
    it is in this bed nice for to sleep  
   b. Dit bed is prettig om *(in)te slapen  
       this bed is nice for in to sleep

It is for this reason that I assume that the creation of the adjunct middle can be accounted for if we partially adopt the proposal by A&S in which the adjunct middle is derived from an underlying PP by means of incorporation of the Ploc/instr into the verb, as is illustrated in (26). The process of incorporation accounts for the facts that (i) the preposition in the impersonal middle really 'disappears' in the adjunct middle, (ii) the NP subject is still interpreted as a location or instrument as a result of function composition by which the verb expresses the combined semantics of the verb and the Ploc/instr (cf. A&S) and (iii) unlike the impersonal middle, it is only possible to derive the adjunct middle if some syntactic requirements are met (see (28) - (29) below).

(26) a. V....[pp [Ploc/instr, NP]]  
   b. V + Ploc/instr [pp [l, NP]]

According to A&S, incorporation takes place at a presyntactic level and it has to take place if the logical subject is semantically arbitrary and as a result, cannot project in syntax. By incorporation, the NP embedded in the PP becomes the argument of the complex verb (cf. (26b)), and, since there is no other NP-argument available at LCS this NP is projected as an external argument. In the Limburg dialects, there is, however, no a priori reason why incorporation has to take place at a presyntactic level since the Limburg dialects express middle constructions morphologically. Note also that A&S (1993:69) 'expect that in a language where a middle construction is not marked morphologically (as opposed to passives, LC) it is derived presyntactically'. Consequently, I assume that in the Limburg dialects the proces of incorporation will take place at the syntactic level. Thus, the adjunct middle is derived by incorporation of Ploc/instr into the verb. Since in the impersonal middle the PP is obligatorily present it is rather clear that this PP is a complement of the verb in which the preposition incorporates (cf. A&S 1994:85 for a more extensive discussion). By incorporation, the complement
of the preposition turns into a direct object of the complex verb. What is more, since the Limburg dialects mark both passives and middles morphologically it can be argued that, as in passives, this object becomes the grammatical subject by means of NP-movement to receive nominative case. Note that in the Limburg dialects the verb can always assign (abstract) dative case both in the impersonal and in the adjunct middle. However, only the element \textit{zich}, unlike a lexical NP, is able to absorb this dative case:

(27) a. *Hetslaapt \textit{Piet\textsubscript{est}} goed\textsubscript{in} dit bed
     it sleeps Piet well in this bed
b. *Jan slaapt dit bed\textsubscript{est} goed
     Jan sleeps this bed well

Furthermore, consider the following relative clauses in which the relative pronoun \textit{waar} `where' has been extracted from the PP (so-called R-extraction, cf. Van Riemsdijk 1978). Only if the PP is an adjunct does it constitute a barrier for R-extraction whereas it is fully grammatical if the PP is an argument, as can be seen in (28a) and (29a), respectively. Consequently, incorporation or deriving an adjunct middle is blocked if the PP is an adjunct (cf. (26b)). From this, we may probably conclude that extraction of the prepositional head of the PP\textsubscript{loc/instr} should be allowed for, too.

(28) a. ??het restaurant waar\textsubscript{in} het prettig \textsubscript{[t\textsubscript{in}]} eet
     the restaurant where it nicely in eat
b. ??Dit restaurant eet prettig
     this restaurant eats nicely

(29) a. het bed waar\textsubscript{in} het prettig \textsubscript{[t\textsubscript{in}]} slaapt
     the bed where it nicely in sleeps
b. Dit bed slaapt prettig
     this bed sleeps nicely

From the above, we may conclude that in the Limburg dialects a syntactic rule of incorporation is allowed if (i) the PP is the verbal complement and (ii) if the NP is the complement of the locative or instrumental P. In that case, incorporation or middle formation creates an adjunct middle out of an underlying locative or instrumental preposition.

3.0 Conclusion

In this paper I have presented syntactic changes that have taken place in the dialects of Limburg between 1885 and 1994. The most important change is that incorporation or middle formation which creates an adjunct middle out of a locative and instrumental PP has become a productive process such that this rule comes to cover a larger area, in particular, (i) the adjunct middle with \textit{zich}, e.g. the northern Limburg variant, has expanded to the south and further to the north and (ii) the instrumental construction has come to undergo middle formation and as a result a reflexive variant has emerged.
